## Title

Algorithm for generation of the nodal impedance matrix for networks containing mutually coupled inductors 36
Application of reliability evaluation methods to the planning of large hydroelectric systems 142
Approach to the non-linear mathematical modelling and the numerical simulation of once-through subcritical steam generator dynamics 9
Comparison of dynamic security indices based on direct methods 210
Comparison of methods for transmission system expansion using network flow and DC load flow models 17
Composite system reliability evaluation 174
Computer simulation for prediction of dynamic responses of marine AC/DC power system 2
Concepts of power system reliability evaluation 139
Development of a new power reliability criterion for the Swedish Power Pool 151
Development of a simulation model of turbocharged diesel engine prime-movers for power system studies 123
Different approaches to reliability as applied to the generation-transmission system and its components 168
Digital protection of transmission lines using block pulse functions 274
Distribution system reliability performance and evaluation 190
Effects of protection systems operation and failures in composite system reliability evaluation 180
Efficient methodology for steady-state security assessment of power systems 110
Electronic suppression of transformer inrush currents 54
Fast interactive optimal load management algorithm under time-varying tariffs 260
General treatment of phase faults on a six-phase generator 247
Implications of reliability worth 201
Lyapunov stability analysis of a synchronous machine with damping fluxes—Part II: numerical estimation of the critical clearing time by the equivalent critical energy approach 41
Optimal design of two-volatge power distribution networks 130
Power system protection and substation control: trends, opportunities and problems 101
Power system reinforcement through reliability and revenue considerations 59
Powerful algorithm for power system planning amenable to small computers 271
Probabilistic simulation of generating system operation including seasonal hydro reservoirs and pumped-storage plants 25
Procedures, experience and application of bulk power reliability evaluation of ENEL, Italy 156
Prospects of expert systems in power system operation 71
Real-time network security monitoring, assessment and optimization 83
Semi-implicit Runge-Kutta methods for power system transient stability studies 253
Simplified method for evaluating the losses in an unbalanced three-phase power system 117
Stochastic modelling of harmonics due to existing and prospective harmonic sources 134
Transient energy function method 233
User-oriented software in energy management systems 66
